JANUARY. *1 Month.*

Hail, *infinite* CREATOR! with thy Praise
The Muse began, with thee shall end my Lays,
These are thy Works, blest *Architect* divine!
This *Earth*, and all this beauteous Offspring thine,
Thy Breath first bid *inactive Matter* move,
And strait with Life the genial *Atoms* strove
Producing *Animal*, and *Plant*, and *Flow'r*,
Concurrent Proof of *Wisdom*, and of *Pow'r*.

Conclusion of the Piece begun in our last.

4. MARS is the fourth primary Plane in the Solar System; for the Moon is properly to be termed a Satellite, or secondary Planet, as respecting the Earth, and not the Sun, for her Centre. He revolves round the Sun in the Space of near two Years, at the Distance of about 120 Millions of Miles. His Bulk is reckoned to be much inferior to that of the Earth. It is by the Parallax of this Planet, that the best Estimate has yet been made of the true Distance of the Sun from the Earth and other Planets. He turns round his own Axis in very nearly the same Time as the Earth, as is evident by the Spots seen on his Face with Telescopes. It has not yet been discovered, whether this Planet has any Satellite or Moon belonging to him or not. That his Orbit is without that of the Earth, and consequently that he revolves round the Sun at a greater Distance than the Earth, is evident from his being often seen in the Side of the Heavens opposite to the Sun. He is sometimes seen through Telescopes as the Moon appears in her third Quarter, Part of his dark Side being then turned towards us, which shews that his Light is borrowed from the Sun. This Planet appears always with a troubled ruddy Light, from whence, and from the Appearance of the fixed Stars near his Body, Astronomers conjecture that he is surrounded with a very gross Atmosphere, and that the Appearance of Belts or *Fasciæ* upon his Face

are
